

RR Database Tags

This document is used to describe the tagging system used in the Registered Reports Zotero Library (https://www.zotero.org/groups/5937153/registered_reports). Zotero uses "tags" to indicate shared properties of specific items. We use these tags to make it easy to identify different types of items and items from different sources.

If you have questions about the database, recommendations for new tags, papers that should be included but are not, or are interested in joining the project as a contributor, please contact the team lead (Amanda Montoya) at akmontoya@ucla.edu.

If you use this database for research purposes, please cite as:

Montoya, A. K., Krenzer, W. L. D., Buchanan, E. M., Pronizius, E., Wang, Y. A., Morillo, D., ... Spitzer, L. (2025, December 19). Database of Published Registered Reports. Retrieved from osf.io/vur72

Additional information about the project and its contributors are available here:
<https://osf.io/vur72>

Definitions:

Manuscript: General term used to capture any and all of the following...

Preprint: Author hosted version of a manuscript. Hosted on a preprint server (e.g., JMIR Preprints, ArXiv, PsyArxiv)

Stage 1 Manuscript: A manuscript describing the rationale and planned methods and analysis for a study, peer reviewed prior to collecting and/or analyzing data. Typically includes introduction, methods, and analysis plan.

Stage 2 Manuscript: A complete manuscript (Stage 1 + Results + Discussion) for a study that was registered (i.e., has a Stage 1 manuscript that was peer reviewed).

Protocol: A paper describing the planned data collection (and maybe analysis) for a study. Typically written as a complete product, in contrast to a Stage 1 manuscript which is incomplete. Protocols may be tagged as Stage 1 manuscripts to facilitate linking across research products.

Acronyms:

JMIR: Journal of Medical Internet Research

RR: Registered Report

TAGS

Stage 1 Manuscript Status

Stage 2 Manuscript: This item is a Stage 2 manuscript

Stage 1 Linked: Stage 1 manuscript is included in Zotero database and linked

JMIR may link a "preprint" of the Stage 2 manuscript, which is not a Stage 1 manuscript. Rather it may be an author formatted version of the Stage 2. Typically, if there are complete results and discussion, this would not be considered a Stage 1 manuscript.

Stage 1 Not Found: The Stage 1 manuscript was not found by a RR database contributor.

If the Stage 2 manuscript has a link to Stage 1, but the document is not available (e.g., withdrawn from PsyArxiv, "per the author's request this version is not available"), this should be marked as "Stage 1 Not Found." Create a snapshot of the linked page, tag this as a Stage 1, and relate this to the Stage 2 manuscript.

Stage 1 Manuscript: This item is a Stage 1 manuscript, and (if available) linked to the relevant Stage 2 manuscript.

Study Characteristics

Programmatic

Multiple Stage 2 manuscripts attached to the same Stage 1

Multiple Study

RR contains multiple studies with independently collected samples. This is distinct from having multiple research questions within the same study.

NOTES: Can we figure out if it was multiple registration (each study is registered) vs. pilot (early studies)?

Replication

RR contains a study that is a replication of another study

Open Science Practices

Open Data

Links to available dataset for at least one study in the paper.

Open Code

Links to available code for analysis of at least one study in the paper.

Open Materials

Links to available study materials (e.g., surveys, stimuli, interview scripts) for at least one study in the paper.

Preregistration Linked: Preregistration is included in Zotero database and linked

Preregistration is not the same as a Stage 1 Manuscript. If a project has the Stage 1 manuscript in the registration, tag as "Stage 1 Linked". Preregistrations will follow templates (e.g., OSF, AsPredicted) rather than manuscript style.

Open Access

Article is freely available to the public.

Open Peer Review

Peer review record is available for this paper (All PCI-RR papers)

JMIR Specific Tags

The following are tags of the designations for timing of registration for JMIR papers. We use the JMIR designations as described on [this page](#).

JMIR: DE Data Existing

JMIR: PRE-registered

JMIR: Registered

JMIR: POST

JMIR: Stage 2 Only: Stage 2 manuscript published in JMIR, but Stage 1 manuscript published in another publisher (e.g., BMC)

JMIR: Stage 1 Only: Stage 1 manuscript published in JMIR, but Stage 2 manuscript published in another publisher (e.g., BMC)

Publisher Notes

Wiley uses two article type names interchangeably: 1) "Registered Report Stage 2" (e.g., <https://onlinelibrary.wiley.com/doi/full/10.1111/ejn.14563>) and 2) "Registered Report Stage 2: Completed Study" (e.g., <https://onlinelibrary.wiley.com/doi/full/10.1111/jcal.12459>).

PLOS's Definition of "Preregistered Research Articles": Preregistered Research Articles present research resulting from a Registered Report, where the study design and methods were peer reviewed before data collection. (<https://journals.plos.org/plosbiology/s/what-we-publish>)

Registered Report
Preregistered Report
Two-stage peer review with IPA

PCI-RR

Peer-reviewed and recommended through Peer Community in Registered Reports (PCI-RR)

Internal Use Tags

Our team is regularly working with the database to tag papers and identify issues. You may see tags that are all in lower case which means they are for internal use. You can disregard, but we have also made note of important

question: indicates manuscripts that we need to check in on in our small group meeting.

Folders

JMIR Issues: These are papers with limited evidence that they are Registered Reports. We're working directly with JMIR to resolve these, and clarify for users of the database their RR status.

Publisher Folders (e.g., JMIR, APA): Publishers tend to format their information similarly making it easier for the team to organize papers by publishers for ease of coding. You may see these folders in the database, which we use to actively update tags and linking information.

OSF Specific Information

Item type:

OSF items that do not have a child item/file should be item type 'Web Page' in zotero

OSF items that do have a file/child item should be item type 'Manuscript'

Importing information/details

When importing stage 1 manuscripts from OSF, they will not always import the author names correctly. After adding the item to zotero, **please check for author names**, and if they have not imported please manually import them from the contributors list on OSF

When importing from “**view only**” **OSF links**, Zotero does not import the link correctly, please copy the link from the address bar and replace the link zotero imports with that link.
